Many wonder what admiralty and maritime laws deal with. The fact is, these laws were designed to deal with the way in which waterborne crafts interact with each other. Maritime laws are designed to settle disputes, encourage commerce and help injured seamen and sailors.

Maritime law in the United States is compiled by a list of statutes which cover all waterborne activities taking place in United States waters. In the past, maritime laws only covered specific incidents such as victims of maritime air disasters and specific areas such as inland water workers. Modern day maritime law now encompasses a much larger field of occupations, accidents and conditions.

There are currently many law firms that represent the sailors, longshoremen and seamen who have been injured while working offshore. The maritime and admiralty laws were designed by the United States government and have dozens of levels of federal, state and local rules that apply to different situations. Because of this, maritime litigation is often very comprehensive.

Some of the types of maritime accidents that can occur include accidents on barges, ferries, casino ships, cruise ships, shipping vessels, tankers and tugboats. There are literally thousands of types of these boats, but those are the major ones. In addition, there are many types of workers who are covered by these maritime and admiralty laws. Some of the jobs include seamen, engine utility men, deck engineers, harbor pilots, longshoremen, dock workers, fishermen, ferry workers and barge hands.

If you are a sailor, seamen or any other type of offshore worker, and have been involved in a maritime accident, then you have the right to take legal action.
